

# Exchange rates

I used React to implement the required page.

The component DatePicker is generic and independent from the application logic. It supports a date range that I set between 01/04/1999 (the first day with available data from <http://exchangeratesapi.io>) and the current day.

As suggested in the API documentation, the request data get cached to avoid more requests for the same day and currency.

If the request to the API is about a Saturday or Sunday it returns the exchange rates of last Friday. I considered valid these rates even if the days don't match.
